11/18/2020

Last Week: No really big problems with the added features, feeling comfortable working with the app. We didn't really get any tests set up for last week, so that is something that is going to be getting done for all future weeks. Initial issues with deploying on AWS EB, able to deploy but with several errors that we will need to look over. Deployment was added as an issue for week 3, given 8 story points, due to being unknown on estimation of difficulty in getting it correctly working.

Story Points Completed: 6 points

This Week: This week's sprint we are planning on adding filtering by recipes to the search field. Currently the functionality of the search box is to search by recipe name. New Feature will be a dropdown menu that has the search criteria. Default is going to be "searching by recipe name" and another option which can be selected as "searching by ingredient". This will be extended to other options of filtering if needed. Tests needed are going to be filtering and then checking that the correct output from the applied filter is returned.
